

I claim:

1. A screw jack socket comprising,
a tube having a lower end and an upper end,
the lower end having an end surface lying in a plane perpendicular to
the longitudinal axis of the tube, and a pair of notches therein extending
longitudinally and lying on a single diametrical line,
the upper end including a cap sealing the tube from the exterior except
through the notches, and a drill bit embedded in the cap and extending upwardly
therefrom beyond the cap enabling operable engagement therewith by a drill.
2. A screw jack socket according to claim 1 wherein,
the tube and cap are constituted by a single, integral article of molded
plastic.
3. A screw jack socket according to claim 2 wherein the drill bit is made of
steel.
4. A screw jack socket according to claim 3 wherein,
the tube from the cap through the lower end, is entirely hollow without
protuberances and obstructing elements.

5. A screw jack socket according to claim 1 wherein,
the cap is separate from the tube, and includes a top element and a longitudinal surrounding skirt surrounding the tube, and
the cap is secured to the tube by glue.
6. A method of using a screw jack socket, in connection with scaffolding that includes vertical structural legs and screw jacks detachably fitted in the lower ends of the legs for enabling vertical adjustment of the legs to move the lower ends of the legs into a common horizontal plane,
the screw jacks having narrow up-standing stems,
the socket including a hollow interior capable of receiving the stems thereinto, selectively, and operating the socket until the respective jack is at the desired height.
